(Received 27 December 2003, Accepted 6 March 2004)

Several new pyrazolo[3,4-d]pyrimidine, pyrazolo[3,4-e][1,4]diazepine, pyrazolo[3,4-d][1,2,3]triazine and pyrolo[4,3$e][1,2,4]$ triazolo $[1,5-c]$ pyrimidine derivatives were prepared by the reaction of the corresponding 5-amino-pyrazole-4-carbonitrile derivative with different organic reagents under different reaction conditions. Using IR, ${ }^{1} \mathrm{H}$ NMR, and mass spectra we have characterized all new compounds.

Keywords: Pyrazolo[3,4-d]pyrimidine, Pyrazolo[3,4-e][1,4]diazepine, Pyrazolo[3,4-d][1,2,3]-triazine, Pyrolo[4,3-e][1,2,4] diazole[1,5-a]pyrimidine, IR, ${ }^{1} \mathrm{H}$ NMR

## INTRODUCTION

Azoloazines are biologically interesting molecules and their chemistry is now receiving considerable attention [1-3]. Furthermore, the considerable biological activities of pyrazole, and its annelated derivatives as antimycotics [4] antidepressants [5], fangicidal agents [6], herbicidal agents [7] are of increasing interest. Also, compounds containing the triazolo[1,5-c]pyrimidine moiety have attracted considerable attention due to their remarkable adenosine and benzodiazepine receptor affinity. Particularly, the 5-amino-9-chloro-2-(2-furyl)-1,2,4-triazolo[1,5-c]quinazoline $\mathbf{1}$ was found to be a highly potent adenosine antagonist [8], while the 9-chloro-2-(2-fluorophenyl)-1,2,4-triazolo[1,5-c]quinazolin-5 $(6 H)$-one 2 displayed a very significant benzodiazepine binding activity [9]. This current pharmacological interest has stimulated our interest in the synthesis of several new and biologically active derivatives with these ring systems.

## EXPERIMENTAL SECTION

All melting points were uncorrected. IR. ( KBr ) spectra were recorded on a Shimadzu 408 spectrophotometer as a solid suspended in a potassium bromide disk. Mass spectra were recorded on GCMS QP1000 EX mass spectrometer with an ionization potential of 70 eV . ${ }^{1} \mathrm{H}$ NMR Spectra were recorded on a 90 MHz Varian EM-390 spectrometer with hexadeuterodimethylsulfoxide as a solvent, using $\mathrm{Me}_{4} \mathrm{Si}$ as an internal standard. Chemical shift values ( $\delta$ ) are reported in

## RESULTS AND DISCUSSION

We have found that the 5 -amino-1-(5, 6-diphenyl-1,2,4-triazen-3-yl)-pyrazole-4-carbonitrile 5, (which resulted in an $80 \%$ yield, via the reaction of the known 5,6-diphenyl-3-hydrazenyl-1,2,4-triazole [10] 3 with ethoxymethylenemalononitrile 4 in refluxing ethanol, (Scheme 1) is an attractive starting material for the preparation of some new polycyclic azines. Thus, the treatment of compound 5 with

Scheme 1
benzonitrile in refluxing isopropanol containing a catalytic amount of sodium methoxide resulted in the formation of the corresponding 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-1H-pyrazolo [3,4-d]pyrimidin-4-amine, compound 6, with a $63.3 \%$ yield. The structure of compound $\mathbf{6}$ was established on the basis of elemental and spectral analyses of the isolated product. Thus, mass spectrum showed a $\mathrm{m} / \mathrm{z}$ ratio of 442.19 . The IR spectrum revealed absence of the cyano group that had appeared at 2225 $\mathrm{cm}^{-1}$ in the IR spectrum of compound 3 . In addition, the ${ }^{1} \mathrm{H}$ NMR spectrum showed the presence of the characteristic signals of one $\mathrm{NH}_{2}$ group at $\delta=5.75 \mathrm{ppm}$.

The ethyl-4-cyano-1-[5,6-diphenyl-1,2,4-triazin-3-yl]-1H-pyrazol-5-ylimidoformate, 7, resulted in a $70 \%$ yield via treatment of compound 5 with triethylorthoformate (T.E.O.F.) in acetic anhydride. The structure of 7 was confirmed based on its elemental and spectral analyses. Heating of compound 7 with hydrazine hydrate in benzene-water mixture resulted in a $61 \%$ yield. The $N^{\prime `}$-[4-cyano-1-(5,6-diphenyl-1,2,4-triazin-3-yl)-1H-pyrazol-5-yl]imidoformic hydrazide, 8, which transformed into the 1-(5,6-diphenyle-1,2,4-triazin-3-yl)-4-imino-1,4-dihydro-5H-pyrazolo[3,-4-d]pyrimidin-5-amine, 9 by heating in refluxing dry benzene resulted in an $81 \%$ yield. On heating of $\mathbf{9}$ in glacial acetic acid-acetic anhydride mixture, the 7-(5,6-diphenyl-1,2,4-triazin-3-yl)-2-methyl-7H-pyrazolo[4,3-e] [1,2,4]triazolo[1,5-c]pyrimidine, 10, was obtained with a yield of $69 \%$ (Scheme 2). The structure of compound 10 was confirmed from its elemental and spectral analyses which showed the molecular ion peak at $\mathrm{m} / \mathrm{z}$ ratio of 405,12 . Also, IR spectrum of 10 revealed the absence of the characteristic stretching vibrations due to the $\mathrm{NH}, \mathrm{NH}_{2}$, and CN groups, which appear at $v=3450-3300$, and $2225 \mathrm{~cm}^{-1}$ regions in the IR spectra of compounds 8 and 9 . In addition, the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 0}$ showed the presence of the

characteristic signals of a methyl group at $\delta=2.81 \mathrm{ppm}$, beside a signal at $\delta=8.96 \mathrm{ppm}$ due to one proton.

On the other hand, compound $\mathbf{1 0}$ was obtained via heating of $\mathbf{8}$ in refluxing acetic anhydride-acetic acid mixture. By treatment of 7 with benzohydrazide in refluxing ethanol, the $N$-[4-imino-1-(5,6-diphenyl-1,2,4-triazin-3-yl)-1,4-dihydro$5 H$-pyrazolo[3,4-d]pyrimidin-5-yl] benzamide 11 was formed with a $76 \%$ yield, which was converted into 5 -amino- $N^{1}$ -benzoyl-1(5,6-diphenyl-1,2,4-triazin-3-yl)1H-pyra-zole-4-carbohydrazonamide 12, with a $61 \%$ yield, in $10 \%$ hydrochloric acid. The proposed structures for $\mathbf{1 1}$ and $\mathbf{1 2}$ were supported by the following features: the IR spectrum of $\mathbf{1 1}$ revealed the absence of any nitrile band in the $2220 \mathrm{~cm}^{-1}$ region. In the mean time, the characteristic stretching vibrations due to amidic carbonyls at $1650 \mathrm{~cm}^{-1}$ region were present for both of these compounds. Also, the ${ }^{1} \mathrm{H}$ NMR spectrum of compound 12 revealed the presence of two amino groups signals at $\delta=$ 5.55 , and 6.80 ppm , beside a broad signal at $\delta=10.21 \mathrm{ppm}$ for the NH proton. However, for compound 11, the ${ }^{1} \mathrm{H}$ NMR spectrum revealed the presence of two signals at $\delta=9.32$, and 10.32 ppm due to two NH groups, in addition to one signal at $\delta=8.85 \mathrm{ppm}$ due to one proton.

The fusion of compound 12 with guanidine carbonate under somewhat reduced pressure yielded 7-(5,6-diphenyl-1,2,4-triazin-3-yl)-2-phenyl-7H-pyrazolo[4,3-e][1,2,4]triazolo, $5[1-c]$ pyrimidin-5-amine, 13, with a $43 \%$ yield. Furthermore,
the heating of compound 12 in $5 \%$ ethanolic acetic acid produced 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-4-(3-phenyl-1H-1,2,4-triazol-5-yl)-1H-pyrazol-5-amine, 14, with a $63 \%$ yield. Treatment of $\mathbf{1 4}$ with acetyl chloride and chloroacetyl chloride in refluxing glacial acetic acid produced 7-(5,6-diphenyl-1,2,4-triazin-3-yl]-2-phenyl-5-methyl-7H-pyrazolo-[4,3-e] [1, 2,4]triazolo[1,5-c] pyrimidine, 15, with a $85 \%$ yield, and 5-chloromethyl-7-(5,6-diphenyl-1,2,4-triazin-3-yl)-2-phenyl-7H-pyrazolo[4,3-e][1,2,4]triazlo[1,5-c]pyrimidine 16 with a $79 \%$ yield. The following features supported the proposed structures for $13,14,15$, and 16 . The IR spectra of $13,14,15$, and 16 showed the absence of the amidic carbonyl bands in the a $v=1650 \mathrm{~cm}^{-1}$ region which appeared in the IR spectrum of compound 12. In addition, the ${ }^{1} \mathrm{H}$ NMR spectrum of compound 13 showed the appearance of only one $\mathrm{NH}_{2}$ signal at $\delta=9.50 \mathrm{ppm}$ in compound 13, and one $\mathrm{NH}_{2}$ group signal at $\delta=6.73 \mathrm{ppm}$ in addition to one NH signal at $\delta=11.62 \mathrm{ppm}$ in compound $14{ }^{1} \mathrm{H}$ NMR spectrum. Furthermore, the ${ }^{1} \mathrm{H}$ NMR spectra revealed the appearance of one methyl signal at $\delta=$ 2.43 ppm in case of compound 15 , and one methylene signal at $\delta=4.60 \mathrm{ppm}$ in the case of compound 16 . On the other hand, treatment of compound 16 with an excess of piperidine afforded 7-(5,6-diphenyl-1,2,4-triazin-3-yl)-2-phe-nyl-5-(piperidin-1-ylmethyl)-7H-pyrazolo[4,3-e][1,2,4]tri-azolo[1,5c]pyrimidine, 17, with a $76 \%$ yield (Scheme 3), and its structure was confirmed on the basis of its elemental and

Scheme 3

Scheme 4
spectral analyses. Thus, mass spectrum revealed an ion peak at $\mathrm{m} / \mathrm{z}=564.32$. Also, the ${ }^{1} \mathrm{H}$ NMR spectrum showed the presence of the characteristic signals at $\delta=2.42-1.55 \mathrm{ppm}$ due to five $\mathrm{CH}_{2}$ groups in addition to a singlet signal at $\delta=3.64$ ppm due to one $\mathrm{CH}_{2}$ group.

On treatment of 7 with mercaptoacetic acid in dry benzene, the 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-5-(2-ethoxy-4-oxo-1,3-thiazolidin-3-yl)-1H-pyrazole-4-carbonitrile derivative 18 was obtained in $68 \%$ yield, which on heating in a refluxing ethanolic sodium methoxide solution afforded the 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-8-ethoxy-1H-pyrazolo[4,3-e][1,3] thiazolo[3,4-a] pyrimidin $-4(5 \mathrm{H})$-one, 19 , with a $72 \%$ yield (Scheme 4). Structures 18 and 19 were confirmed by the elemental analysis as well as the spectrometric studies. The ${ }^{1} \mathrm{H}$ NMR spectrum of compound 18 revealed the presence of a singlet signal at $\delta=3.33 \mathrm{ppm}$ due to one $\mathrm{CH}_{2}$ group, and a singlet signal at $\delta=5.98 \mathrm{ppm}$ due to the thiazolidine $\mathrm{C} 2-\mathrm{H}$, in
addition to the characteristic triplet, quartet signals at $\delta=1.12$ and 3.41 ppm due to -OEt group. However, in the case of compound 19, the ${ }^{1} \mathrm{H}$ NMR spectrum showed the broad signal for one NH proton at $\delta=10.06 \mathrm{ppm}$, the characteristic triplet, quartet signals at $\delta=3.50 \mathrm{ppm}$, and at $\delta=1.13 \mathrm{ppm}$ due to -OEt group, the presence of two singlet signals at $\delta=5.13$ and 4.19 ppm due to $\mathrm{C} 8-\mathrm{H}$ and $\mathrm{C} 6-\mathrm{H}$. Also, the IR spectrum of compound 19 showed the absence of any cyano groups.

The urea-hydrogen peroxide adduct (UHP) [11], an inexpensive, stable, and easily handled reagent, has shown utility for mild and efficient transformation of nitriles into their corresponding amides [12]. So, compound 5 was converted into 5-amino-1-(5,6-diphenyl-1,2,4-triazin-3-yl)$1 H$-pyrazole-4-carboxamide, 20, at room temperature with a $89 \%$ yield, using an excess of urea-hydrogen peroxide adduct (UHP) in the presence of a catalytic amount of potassium carbonate in an acetone-water mixture as a solvent. Heating of

20 with triethylorthoformate in refluxing acetic anhydride, resulted in the formation of 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-1,5-dihydro-4H-pyrazolo [3, 4-d]pyrimidin-4-one, 21, with a $69 \%$ yield. On the other hand, the heating of 20 with diethyl oxalate in refluxing ethanol yielded the ethyl \{[4-(aminocarbonyl)-1-(5,6-diphenyl-1,2,4-triazin-3-yl)-1H-pyra-zol-5-yl]amino\}(oxo)acetate, 22, which was converted into the ethyl 1-(5,6-diphenyl-1,2,4-triazin-3-yl)-4-oxo-4,5-dihydro-1H-pyrazolo[[3,4-d]pyrimidine-6-carboxylate, 23, by heating it in refluxing glacial acetic acid resulting in a $73 \%$ yield
(Scheme 5). Structures 20, 21, 22 and 23 were confirmed by the elemental and spectral analyses of the isolated products. The 6,7-diphenyl-1-(5,6-diphenyl-1,2,4-triazin-3-yl)pyrazolo $[3,4-e][1,4]$ diazepin- $4(1 H)$-one, 24, was formed with a $73 \%$ yield by the fusion of $\mathbf{2 0}$ with benzoin in the presence of anhydrous $\mathrm{ZnCl}_{2}$. The structure of 24 was confirmed by elemental and spectral analyses, which revealed an ion peak at $\mathrm{m} / \mathrm{z}$ ratio of 531.20 as a base peak in the mass spectrum. Further reaction of $\mathbf{2 0}$ with benzoin n a refluxing glacial acetic acid-acetic anhydride mixture, afforded a product with a

Scheme 5

Scheme 6
molecular formula of $\mathrm{C}_{35} \mathrm{H}_{23} \mathrm{~N}_{7} \mathrm{O} \quad(\mathrm{m} / \mathrm{z}=557.20)$. The ${ }^{1} \mathrm{H}$ NMR spectrum of the isolated product showed a broad band (exchanges with $\mathrm{D}_{2} \mathrm{O}$ ) for only one proton at $\delta=9.18$ ppm and a multiplet in the aromatic region due to 22 protons. According to these results, the 1-(5,6-diphenyl-1,2,4-triazin-3-yl]-7,8-diphenyl-1H-pyrazolo[4,3-e]pyrrolo[1,2-a]pyrimidin$4(1 \mathrm{H})$-one, 27 , is the suitable structure for the isolated product. Compound 27 may be formed via the first formation of the N acetyl intermediate 25 which condenses with benzion to give the intermediate 26. The latter then loses two molecules of water to give the isolated product 27 (Scheme 6).

Diazotization and self coupling of the amino amide 20 gave 7-(5,6-diphenyl-1,3,4-triazin-3-yl)-3,7-dihydro-4H-pyrazolo[3, 4-d][1,2,3]triazin-4-one, 28, which was converted to the corresponding 1-(5,6-diphenyl-1,3,4-triazin-3-yl)-5-methoxy-1H-pyrazole-4-carboxamide, 29 , with a $56 \%$ yield on heating in absolute methanol (Scheme 6). Structures 28 and 29 were confirmed by spectral and elemental analyses. The ${ }^{1} \mathrm{H}$ NMR spectrum of 28 showed a broad band (exchanges with $\mathrm{D}_{2} \mathrm{O}$ ) for only one proton at $\delta=9.71 \mathrm{ppm}$ due to an NH group. However, the ${ }^{1} \mathrm{H}$ NMR spectrum of 29 showed, in addition to the broad signal for one $\mathrm{NH}_{2}$ protons at $\delta=6.17 \mathrm{ppm}$, a singlet signal at $\delta=3.12 \mathrm{ppm}$ due to one methyl group.
